Abbreviations](#)[About this Document](#)

L^AT_EX Input

```
\newcounter{ans}  
\setcounter{ans}{9}  
\addtocounter{ans}{11}  
\stepcounter{ans}  
\addtocounter{ans}{\theans}  
The answer to the ultimate  
question of life, the universe,  
and everything is \theans.
```

L^AT_EX Output

The answer to the ultimate question of life, the universe, and everything is 42.

Decision Making

Variables

The `ifthen` Package

The `calc` Package

Looping

Tail Recursion

Acronyms &
Abbreviations

About this Document

- L^AT_EX does not support decision making.
- To make decisions you need T_EX or package such as `ifthen`.

```
\newif\if<switch>  
\<switch>true  
\<switch>>false  
\if<switch><then clause>\fi  
\if<switch><then clause>\else<else clause>\fi
```

Example

About this Document

L^AT_EX Usage

```
\newif\ifnotes
\notesttrue

\begin{document}
\section{\ifnotes Lecture Notes%
         \else Presentation%
         \fi}
...
\end{document}
```

Unit	Name	Equivalent
pt	point	
pc	pica	1 pc = 12 pt
in	inch	1 in = 72.27 pt
bp	big point	72 bp = 1 in
cm	centimetre	2.54 cm = 1 in
mm	millimetre	10 mm = 1 cm
dd	didôt point	1157 dd = 1238 pt
cc	cicero	1 cc = 12 dd
sp	scaled point	65536 sp = 1 pt

- Each length unit represents its own length.
- When L^AT_EX expects a length, writing `1<unit>` results in the length of the unit `<unit>`.
 - For example `1mm` gives you the length of one millimetre.
- Write `<constant><unit>` to multiply `<unit>` and `<constant>`.
 - For example, `101in` is equivalent to `256.54cm`.

- Length variables hold length values.
- You write them just as control sequences.
- Given variable $\langle 1en \rangle$, $2\langle 1en \rangle$ gives you twice its current value.
- There are two kinds of lengths: *rigid* and *rubber*.
 - rigid** A rigid length always has the same size.
 - rubber** A rubber length is a combination of natural length and elasticity.
 - Values may stretch or shrink depending on the situation.
 - Useful for stretching/shrinking inter-word space and so on.
 - Multiplying a rubber length makes it rigid.

Existing Length Commands

```
\parindent  
\textwidth  
\textheight  
\parskip  
\baselineskip
```

Length-related Commands

Branching

Variables

The `ifthen` Package

The `calc` Package

Looping

Tail Recursion

Acronyms &
Abbreviations

About this Document

```
\newlength{<command>}
\setlength{<command>}{<length>}
\addtolength{<command>}{<length>}
\settowidth{<command>}{<stuff>}
\settoheight{<command>}{<stuff>}
\settodepth{<command>}{<stuff>}
```

The `ifthen` Package

```
\newboolean{<bool>}
```

Define variable. May fail.

```
\provideboolean{<bool>}
```

Define variable. Can't fail.

```
\setboolean{<bool>}{<value>}
```

Assign `<value>`.

Decision Making

```
\ifthenelse{<test>}{<then clause>}{<else clause>}
```

- Two-way branching statement.

Valid Conditions

```
<boolean>  
<number1><op><number2>  
\lengthtest{<dimen1><op><dimen2>}  
\isodd{<number>}  
\isundefined{<command>}  
\equal{<string1>}{<string2>}  
\boolean{<bool>}  
<test1><command><test2>  
<negation><test>  
\(<test>\)
```

The `\ifthenelse` Command

L^AT_EX Input

```
\begin{document}
  \ifthenelse
    {\isodd{\value{page}}}
    {Odd page.}
    {Even page.}
\end{document}
```

L^AT_EX Output

Odd page.

The `\whiledo` Command

```
\whiledo{<test>}{<statement>}  
Implements while statement.
```

L^AT_EX Input

```
\newcounter{count}  
\setcounter{count}{3}  
$\thecount = 0  
\whiledo  
  {\not\(\thecount=0\)}%  
  {+ 1 \addtocounter{count}{-1}}$.
```

L^AT_EX Output

3 = 0 + 1 + 1 + 1.

The `calc` Package

Branching

Variables

The `ifthen` Package

The `calc` Package

Looping

Tail Recursion

Acronyms &
Abbreviations

About this Document

- The `calc` package extends TeX and LaTeX's arithmetic.
- Makes counter/length commands accept infix expressions.
- Also provides additional useful commands.
